AI the threat of the coming

In just a few years the fear of dystopia becoming reality has grown as much as AI models have reached important milestones in their applications. To tackle this subject we have for documents, at first a cartoon drew by Moria Kamesky in 2023 pinpointing the subtext of reality by AI, then a transcript of John Roger interviewing Aldous Huxley the author of Brave new world. An extract from an article published in The Sunday Times by Matthew Syed in 2023 highlighting the realization of Huxley fiction in real life. And last but not least an extract of an article from The Economist published in 2023 about measures discussed worldwide for AI.

Then with all considerations taken we can wonder if AI is that much of a threat to humanity.

As Huxley pinpointed, freedom is a complicated matter, however it seems that AI may threaten it. Like a good bottle of wine, the social climate written by Huxley in his essay seems to have emerged nowadays, with a deluge of distraction and AI modifying humans' interactions with their world. AI dangers are starting to exceed expectations, even consciences have been taken to pause any further development for a certain time. The fear of getting enslaved by AI, just as pointed by Kamesky, is becoming real.

Even ~~experts~~ a non reflectable ~~of~~ experts, about half of those interrogated,

agrees that AI may have consequences that could threaten humanity.

However, even though experts agree that AI could be at risk, it is only estimated around 5%. However AI seems not to abuse people's creativity but rather to limit it. For instance Kamenisky drew someone who seems to be Huxley forced to write by AI, nevertheless we can wonder why Kamenisky decided to draw the author and not just the Algorithm writing the essay.

In fact Rino Shichika highlighted in his work that the accessibility of information can describe the world, and overturn historical order. Thus AI, which has brought an infinite flow of information could be the seed of a new revolution just like the printing press in the 15th. Skyped said it, we never had as much information, it is just ~~about~~ ~~of~~ using them efficiently.

The fact that humanity ~~is~~ not becoming water among the ages is a sign that she is not in ~~total control~~ complete control over its ~~own~~ inventions.

Huxley thought it was the ~~biggest~~ ~~the~~ greatest problem of its period. The same thought has arisen in the mind of some tech prominent people.

A secured development environment is needed, because AI has now become as ~~important~~ important as cars ~~and phones~~, it needs its own regulation. Kamenisky drew AI as secret hidden in secured chest, so in order to prevent that government have ~~been~~ taking measures. Whether it's light touch like in Great Britain or in the US or ~~stronger~~ one like in Europe, it seems that there is a need to balance scenarios. Because humanity has lost its ability to stop it is better not to try controlling people. Orwell shows it, censorship does not work indefinitely,

thus it is a better idea to be ready to adapt the rules a per with the size.
